

DATA PREPARATION STEPS

1. Data Import (Excel to Power BI)

2. Data Cleaning in Power Query

// Remove empty rows

```
= Table.SelectRows(Sales_Data, each [Account_Name] <> null and [Account_Name] <> "")
```

// Trim whitespace from text columns

```
= Table.TransformColumns("#Previous Step",{
    {"Account_Name", Text.Trim, type text},
    {"Account_Status", Text.Trim, type text},
    {"Primary_Country", Text.Trim, type text},
    {"Primary_City", Text.Trim, type text}
})
```

// Convert data types

```
= Table.TransformColumnTypes("#Previous Step",{
    {"Revenue_Amount", Currency.Type},
    {"Potential_Business", Currency.Type},
    {"Opportunity_Close_Date", type date}
})
```

// Replace null values in Revenue_Amount with 0

```
= Table.ReplaceValue("#Previous Step", null, 0, Replacer.ReplaceValue, {"Revenue_Amount"})
```

// Create Year column

```
= Table.AddColumn("#Previous Step", "Year", each Date.Year([Opportunity_Close_Date]), Int64.Type)
```

// Create Quarter column

```
= Table.AddColumn("#Previous Step", "Quarter", each Date.QuarterOfYear([Opportunity_Close_Date]), Int64.Type)
```

```
// Create Year-Quarter column
```

```
= Table.AddColumn("#Previous Step", "Year_Quarter", each  
    Text.From([Year]) & " Q" & Text.From([Quarter]), type text)
```

```
// Create Month column
```

```
= Table.AddColumn("#Previous Step", "Month", each Date.Month([Opportunity_Close_Date]), Int64.Type)
```

```
// Create Month Name column
```

```
= Table.AddColumn("#Previous Step", "Month_Name", each Date.MonthName([Opportunity_Close_Date]),  
type text)
```

3. Create Calendar Table

Calendar =

```
ADDCOLUMNS(  
    CALENDAR(DATE(2021, 1, 1), DATE(2027, 12, 31)),  
    "Year", YEAR([Date]),  
    "Quarter", "Q" & FORMAT([Date], "Q"),  
    "Year_Quarter", YEAR([Date]) & " Q" & FORMAT([Date], "Q"),  
    "Month", MONTH([Date]),  
    "Month_Name", FORMAT([Date], "MMMM"),  
    "Month_Short", FORMAT([Date], "MMM"),  
    "Day", DAY([Date]),  
    "Weekday", FORMAT([Date], "dddd"),  
    "Week_Number", WEEKNUM([Date])  
)
```

4. Create Scenario Table (for forecast scenarios)

Scenario =

```
DATATABLE(  
    "ScenarioName", STRING,  
    "ScenarioID", INTEGER,  
    {  
        {"Pessimistic", 1},
```

```

        {"Base Case", 2},
        {"Optimistic", 3}
    }
)

```

5. Establish Relationships

Relationships to create:

- 'Sales Data'[Opportunity_Close_Date] → 'Calendar'[Date] (Many-to-One)
- Mark 'Calendar' table as Date Table

6. Create Calculated Columns (if needed)

// Revenue Share by Rep

```

'Sales Data'[Rep_Revenue_Share] =
DIVIDE(
    'Sales Data'[Revenue_Amount],
    CALCULATE(
        SUM('Sales Data'[Revenue_Amount]),
        ALL('Sales Data'[Account_Name])
    )
)

```

// Days to Close

```

'Sales Data'[Days_To_Close] =
DATEDIFF(
    'Sales Data'[Opportunity_Status],
    'Sales Data'[Opportunity_Close_Date],
    DAY
)

```

// Is Customer Flag

```

'Sales Data'[Is_Customer] =
IF('Sales Data'[Account_Status] = "Active Customer", 1, 0)

```

// Potential Realization %

'Sales Data'[Potential_Realization_%] =

DIVIDE(

'Sales Data'[Revenue_Amount],

'Sales Data'[Potential_Business]

) * 100
